

# NEXT-GENERATION FIREWALL SERVICES DATASHEET

## Product Overview

*Juniper Networks delivers multiple high-performance next-generation firewalls that provide granular control and visibility from client to workload. Visibility, intelligence, and enforcement are fundamental pieces of a threat-aware network. Juniper offers additional security to combat known and unknown threats, including application identification, user identification, protection from network and application exploits, malware detection and prevention, Encrypted Traffic Insights, and URL filtering including blocking malicious websites.*

## Product Description

As distributed workforces become more prevalent, securing the network edge is more critical than ever to ensure users can access the data and applications they need when they need them.

In securing your distributed workforce, cloud-delivered security is not enough. You must start by putting employees first, allowing them to securely access the data and applications they need to do their jobs effectively, and helping you streamline yours. Unbroken visibility from client to workload, security assurance, and a single policy framework are essential tools to help secure your remote workforce.

Access should not increase the organization's risk. Additional security is needed to combat the increasing number of threats organizations face while maintaining user access to new applications on different devices. Juniper Networks® SRX Series Firewalls deliver integrated next-generation firewall (NGFW) protection services with application awareness, user identity, and content inspection for all physical, virtual, containerized, and as-a-service deployments. In addition, the SRX Series firewalls offer intrusion prevention, SSL inspection, anti-spam, anti-virus, URL filtering, and unknown threat detection, thereby providing a single security platform that addresses a wide range of security requirements from a common architecture.

## Architecture and Key Components

The SRX Series' NGFW services architecture includes several key components that provide a powerful platform to protect enterprises and MSPs from constantly evolving and sophisticated cyberattacks.

### User Identification and Access Control: User Firewall

User identity is a core requirement of next-generation firewalls that enables administrators to create security policies that reflect business needs rather than network requirements. This flexibility creates a powerful mechanism for defining, managing, and refining security policies by creating firewall rules based on user identity rather than an IP address. Through Juniper's User Firewall feature, an SRX can associate network traffic with a specific user by integrating directory services such as Active Directory. Organizations can define policies to allow application use based on individual users or user groups, enabling more powerful but simpler security controls. Through User Firewall, security policies can be expressed in terms of groups, allowing security policies to continue functioning as users are added or deleted from groups. In addition, the User Firewall provides visibility into application usage at the user level rather than an IP address, giving you powerful insights into application traffic traversing the network. Security administrators can reduce the threat footprint by adjusting security policies to align application usage with security and business practices.

### Application Identification and Control: AppSecure

The days of tying applications to traditional port-based communications are long gone. Today, new applications are designed to change ports and protocols dynamically. Some are designed to tunnel through services such as HTTP web traffic. This means applications can be used anywhere, at any time the user needs. Empowering users to access applications anywhere poses a challenge in defending against a constantly changing threat landscape that directly targets applications and passes through traditional network-layer protections to protect the enterprise.

Juniper NGFW Services offer a powerful security platform well equipped to meet this challenge. At the core lies AppSecure, which offers robust visibility and control over applications on the network.

AppSecure quickly recognizes applications and surfaces the application name, description of the service, and inherent level of risk, regardless of port, protocol, or encryption method.

Offering deep application visibility and control, AppSecure provides the context that links application use to a user, regardless of location and device. Furthermore, AppSecure understands application behaviors and identifies vulnerabilities, enabling administrators to block risky applications before they can do any damage. AppSecure helps reduce an application's threat footprint by allowing the definition of granular security policies, such as the level of deep packet inspection required and to which users or groups are allowed access.

AppSecure enforces quality of service (QoS) at the application layer, forwarding traffic based on applications, and providing multi-path routing capabilities for critical application traffic.

### Exploit Protection: Intrusion Detection and Prevention (IDP/IPS)

Juniper's intrusion prevention system (IPS) is tightly integrated with Juniper SRX to mitigate network and application exploits and protect against a wide range of attacks. Juniper's intrusion detection system (IDP) constantly monitors for new exploits against recently discovered vulnerabilities, keeping network protection up to date against the latest cyberattacks and stopping them at the exploit stage before they gain a foothold inside the network. IDP signatures can be enabled in detection-only mode or inline to block malicious traffic directly.

Custom signatures can be created using existing signature sets. You can create policies using a pre-defined policy template or based on custom signatures to keep network traffic protected. It allows you to define policy rules to match a section of traffic based on a zone, network, and application and then take active or passive preventive actions on that traffic. You can also take packet capture before and after the attack for further analysis.

### Real-Time Protection: SecIntel

SecIntel provides verified threat intelligence to all points of connection across the network to block malicious traffic, enabling a threat-aware network. To help reduce risk, SecIntel can be deployed on the SRX to block malicious traffic originating from malicious IP addresses and domains without needing deep packet inspection. SecIntel's threat feeds are automated and constantly updated. Additionally, these feeds are scrubbed and verified by Juniper Threat Labs to maintain high detection efficacy and reduce false positives. SecIntel can help reduce the load on the network.

### Block Known Threats: Network Anti-Malware

Malicious files, including ransomware and adware, are becoming more prevalent from multiple attack vectors. These threats compromise network endpoints and make them vulnerable to data theft, including credentials and personally identifiable information (PII). Detecting and blocking malware and unwanted files at the network level before making it onto an endpoint is critical to safeguarding users, data, and infrastructure against attacks. Anti-malware protection combines cloud-based file reputation intelligence and malware signatures with the SRX Series NGFW to deliver lightweight and fast security. Gain a highly effective perimeter defense against known threats without slowing down your users or business. NGFW delivers lightweight and fast security. The result is a highly effective perimeter defense against many known threats, which doesn't slow down your users or business.

### Browsing Defense: Enhanced Web Filtering (EWF)

Users spend over half their time browsing the Internet and using web-based tools. Web traffic must be both legitimate and safe. At the same time, specific web applications, such as online banking or healthcare, must remain private. EWF allows administrators to block unwanted URL categories, such as gambling and malware sites, and enables selective decryption to keep business traffic safe from threats. In contrast, users' personal traffic can remain private. To reduce attacks, EWF contains more than 180 URL categories that can be used within security policies on the SRX.

## Encrypted Protection: SSL Proxy

SSL has become the universal method for authenticating websites and encrypting traffic between Web clients and Web servers.

Since SSL content is encrypted, users can download malware directly onto client endpoints. Since organizations have no visibility into SSL connections, they are blind to any threats transmitted over HTTPS to their corporate enterprise clients.

Juniper offers a powerful application-level SSL proxy that sits between client and server, intercepting encrypted traffic, terminating the session, and re-initiating the connection towards the end destination. It can be used as an SSL “forward” proxy that sits between users on the corporate LAN and their access to the Internet, protecting the end client. It also intercepts HTTPS traffic by acting as a gateway at the enterprise perimeter and terminates the encrypted traffic. At that point, unencrypted traffic is immediately inspected to determine compliance with security policy, as set by the security team. Traffic is then handled by proactive malware engines that will instantly block malware, thwarting any security breach.

The SSL Proxy can be configured with exemptions that prevent traffic between certain URLs from being decrypted for user privacy

protection. The exemptions can be set based on user groups, URL categories, or custom categories. The SSL proxy provides security between clients and the web server the firewall protects. This can be termed as SSL “reverse” proxy, which sits between external connections and web servers that are managed within the organization.

## Unknown Threats: Juniper Advanced Threat Prevention (ATP)

Juniper Advanced Threat Prevention (ATP) is Juniper's threat intelligence hub and uses machine learning algorithms to provide complete advanced malware detection and prevention. ATP supports threat detection without breaking decryption and surfacing compromised devices. When integrated with SRX Series Firewalls, Juniper ATP leverages a global threat database to deliver threat intelligence, dynamic malware analysis, Encrypted Traffic Insights, and adaptive threat profiling. Juniper ATP is offered as a cloud-based service or as an on-premises appliance.

Juniper ATP protects against trojans, worms, ransomware, botnets, IoT threats, and DNS threats like Domain Generation Algorithm (DGA) generated domains and DNS tunneling.

## Features and Benefits

Feature	Description	Benefits
<b>Application identification and policy-based control</b>	Application Identification (AppID) provides a sophisticated classification engine that identifies applications regardless of port or protocol, including those known for using evasive techniques to avoid identification. Delivers detailed analysis of application volume and usage based on bytes, packets, and sessions throughout the network. Enables application usage tracking to identify high-risk applications and analyze traffic patterns to improve network management and control. Application firewall (AppFW) provides policy-based enforcement and control of traffic based on application signatures.	Gives ops teams more granular control by identifying unique applications rather than IP addresses to enforce corporate security policies to match your specific business requirements. Enables application usage tracking to identify high-risk applications and analyze traffic patterns to improve network management and control. Enhances security policy creation and enforcement based on applications and user roles rather than traditional port and protocol analysis.
<b>AppQoS</b>	Leverages Juniper's rich QoS capabilities to prioritize applications based on customers' business and bandwidth needs.	Allows users to prioritize traffic and limit and shape bandwidth based on application information and contexts for improved application and overall network performance.
<b>Advanced Policy-Based Routing (APBR)</b>	Classifies sessions based on applications and applies the configured rules to reroute the traffic.	Provides the ability to route traffic over different WAN links and assign higher priority to business-critical applications.
<b>User Firewall</b>	Integrates with directory services such as Active Directory to create firewall policies associated with specific users or groups to enforce security protection.	Enables more accurate and granular security policies through powerful but simplified security controls.
<b>SSL Proxy</b>	Sits between client and server, intercepting encrypted traffic, terminating the session, and re-initiating the connection towards the end destination, and can be used as an SSL “forward” proxy to protect the end client.	Prevents users from directly downloading malware hidden within encrypted traffic on their end clients.
<b>Intrusion Detection System/ Intrusion Prevention System (IDS/IPS)</b>	Offers comprehensive protection against a broad range of known security exploits in applications, databases, and operating systems.	Constantly monitors for new exploits against newly discovered vulnerabilities to ensure that network protection is up to date against the latest attack cyber methods.
<b>Juniper Advanced Threat Prevention</b>	Provides cloud-based service that performs advanced malware detection through powerful machine learning algorithms to identify previously unseen security threats.	Accurately identifies unknown and never-before-seen malware that eludes conventional methods, ensuring complete protection.
<b>SecIntel</b>	Generates threat feeds that include attacker IPs, C&C, GeolIP, infected hosts, and dynamic address groups.	Reduces risk by enabling Juniper switches, routers, and firewalls to identify and block potential threats.
<b>Encrypted Traffic Insights</b>	Enables SRX Series Firewalls to block malicious traffic without decrypting the session. It collects relevant SSL/TLS connection data, including certificates used, cipher suites negotiated, and connection behavior. This information is processed by Juniper ATP, which uses network behavioral analysis and machine learning to determine whether the connection is benign or malicious. Policies on SRX Series Firewalls can be used to block encrypted traffic identified as malicious.	Restores visibility lost due to encryption without the heavy burden of full TLS/SSL decryption.

Feature	Description	Benefits
<b>Adaptive Threat Profiling</b>	Allows organizations to leverage their existing infrastructure to create security intelligence feeds based on real-time events occurring on their network. These feeds, unique to each organization, can be configured based on security policies and utilized by other enforcement points on the network to detect threats and update their infrastructure in real-time, blocking potential attacks.	Improves threat response times by taking real-time threat information and pushing it out to all points across the network.
<b>Anti-Malware</b>	Anti-Malware. Protects against malware, viruses, phishing attacks, intrusions, spam, and other threats through anti-virus, anti-spam, and Web and content filtering.	Implements real-time security defense that ensures businesses have up-to-date signatures that provide visibility into threats from all over the world.
<b>URL Filtering</b>	Provides web traffic categorizations that can be incorporated into the application.	Prevents web-borne threats and unwanted browsing activity.
<b>Security Director</b>	Streamlines operations by centrally managing all NGFWs from a single pane of glass.	Simplifies complex security policy management and implementation through easy-to-use GUI, saving time and increasing productivity.
<b>Juniper Secure Edge</b>	Delivers full-stack SSE capabilities, including FWaaS, SWG, CASB with DLP, ZTNA, and advanced threat protection to protect access to web, SaaS, and on-premises applications and provide users with security that follows them wherever they go.	Secures workforces anywhere with the fast, reliable, and secure access they need. Juniper meets customers where they are and takes them where they want to go by leveraging what they have and extending their zero-trust initiatives to a cloud-delivered architecture without breaking the bank or their ops team.

## Juniper Security Director Cloud

Security Director Cloud is Juniper's simple and seamless management experience delivered in a single UI to connect customers' current deployments with their future architectural rollouts. Management is at the center of the Juniper Connected Security strategy and helps organizations secure every point of connection on their network to safeguard users, data, and infrastructure.

Organizations can secure their architecture with consistent security policies across any environment—on-premises, cloud-based, cloud-delivered, and hybrid—and expand zero trust to all parts of the network from the edge all the way into the data center and to the applications and microservices. With Security Director Cloud, organizations have unbroken visibility, policy configuration, administration, and collective threat intelligence all in one place.

Juniper meets our customers where they are on their journey, helps them leverage their existing investments, and empowers them to transition to their preferred architecture at a pace that is best for business by automating their transition with Security Director Cloud.

## Juniper Secure Edge

Juniper Secure Edge secures workforces anywhere with the fast, reliable, and secure access they need. Delivers full-stack SSE capabilities, including FWaaS, SWG, CASB with DLP, ZTNA, and advanced threat protection to protect access to web, SaaS, and on-premises applications and provide users with security that follows them wherever they go. Juniper meets customers where they are and takes them where they want to go by leveraging what they have and extending their zero-trust initiatives to a cloud-delivered architecture without breaking the bank or their ops team.

Juniper Secure Edge, managed by Security Director Cloud, uses a single policy framework that enables security policies to be created

once to follow users, devices, and data wherever they go.

Customers don't have to start from scratch when adopting cloud-delivered security. With our three-click wizard, customers can easily leverage existing campus edge policies and translate them into an SSE policy. Because it uses a single policy framework regardless of the deployment model, Secure Edge applies existing security policies from traditional deployments to its cloud-delivered model in just a few clicks, reducing misconfigurations and risk.

Whether securing remote users, campus and branch locations, private cloud, public cloud, or hybrid cloud data centers, Juniper provides unified management and unbroken visibility across all architectures. This makes it easy for ops teams to easily and effectively bridge their current investments with their future architectural goals, including SASE. Customers can manage security anywhere and everywhere, on-premises, in the cloud, and from the cloud, with security policies that follow users, devices, and data wherever they go, all from a single UI.

Users have fast, reliable, and secure access to the data and resources they need, ensuring great user experiences. IT security teams gain seamless visibility across the entire network while leveraging their existing investments, helping them transition to a cloud-delivered architecture at their own pace.

Juniper Secure Edge provides consistent security policies that follow the user, device and data without having to copy over or recreate rule sets. It's easy to deploy cloud-delivered application control, intrusion prevention, content and Web filtering, and effective threat prevention without breaking visibility or security enforcement.

Juniper has been consistently validated by multiple third-party tests as the most effective security technology on the market for the past four years, with 100% security efficacy across all use cases.

## Juniper Networks Services and Support

Juniper Networks is the leader in performance-enabling services that are designed to accelerate, extend, and optimize your high-performance network. Our services allow you to maximize operational efficiency while reducing costs and minimizing risk, achieving a faster time to value for your network. Juniper Networks ensures operational excellence by optimizing the network to maintain required levels of performance, reliability, and availability.

## Ordering Information

To order Juniper Networks SRX Series Firewalls and to access software licensing information, please visit the [How to Buy](#) page on [www.juniper.net](http://www.juniper.net).

## About Juniper Networks

At Juniper Networks, we are dedicated to dramatically simplifying network operations and driving superior experiences for end users. Our solutions deliver industry-leading insight, automation, security and AI to drive real business results. We believe that powering connections will bring us closer together while empowering us all to solve the world's greatest challenges of well-being, sustainability and equality.
